WPC Ceiling

Installation

The ecological wood ceiling is a type of ecological wood product, essentially artificial wood. It is a kind of "greener wood plastic composite material," which is a mixture of resin, wood fiber material, and polymer material in specific proportions. Compared to natural wood, it has good stability, retains the physical characteristics of solid wood, and is waterproof, anti-corrosive, and provides heat insulation. Modifiers such as light and thermal stability, UV resistance, and low-temperature impact resistance are added during the production of ecological wood, giving it strong weather resistance and UV protection.
